NANOSTRUCTURED LUBRICATING OIL ABSTRACT OF THE DISCLOSURE

5

10

A nanostructured lubricating oil formed by mixing 80 wt% of a standard viscosity lubricating oil with 20wt% of nanometered graphite. Alternatively, nanometered silicon oxide and nanometered ferric oxide may be added to the graphite-contained nanostructured lubricating oil so as to form a three-layer structure of ferric oxide-silicon-oxide-graphite, improving heat dissipating, lubricating, and wear resisting performance.
